

ABSTRACT

A poisoning groove 16 is formed at a slide guide shaft 4, and a lever 15 of a driver unit 1 is engaged with the positioning 5 groove to position the driver unit. A clincher unit is positioned by engaging a positioning pin 10 of a clincher unit 2 with a pin hole 13 of a slide guide table 3, the driver unit is provided with an engageable connecting pin 9, and the positioning pin and the connecting pin are driven by a cam plate 12. When 10 the cam plate is rotated by 180 degrees, the positioning pin 10 is detached from the pin hole 13 to make the clincher unit 2 movable, the clincher unit and the driver unit are connected by engaging the connecting pin 9 with the driver unit, and the clincher unit and the driver unit are integrally traveled.
